OPEN ITEMS CHECKLIST — part 10 (5 November 2026)

Changes since part 9. Stage 6n closes three items from part 9. Source: `forth6809_stage_6n.asm`; documentation: `ClaudeForth 20261105` (rebuilt); shadow file: `forth6809 20261105.shd` (HEADER.2, ENVSEARCH.1, MEMMAP.21).

- ☑ **HEADER checks the name length.** Throws -16 for no name and -19 for a name over 31 characters, before anything is changed. `:`, `CREATE`, `VARIABLE`, `CONSTANT` and the other defining words are covered. +17 bytes.
- ☑ **ENVIRONMENT? answers `SEARCH-ORDER` and `SEARCH-ORDER-EXT`** (true true). +40 bytes.
- ☑ **BASECODE and BASEDICT lowered by $40** in all three states (`$D8F6/$CF47`, `$D200/$C840`, `$CE80/$C4B8`). Default build: 12237 bytes of code polled (343 spare), 12556 interrupt (**24 spare**). Unit-test region with both options on: 952 bytes. The same groups fit (13 and 15; and 0, 2, 5, 13-17 with `DECOMP=0`); the scripts need no change.
- ☑ **Tests:** ANS 33 now 78 tests (two ENVIRONMENT? queries), ANS 34 now 23 tests (empty name, 31 and 32 character names for `:`, `CREATE` and `CONSTANT`, and a dictionary check after a failed header). 27 (50), 36 (14), 37 (64), 8 (71), 12 (73) and `see_check.py` (19) pass; all 21 unit-test groups pass with `DISASM=0`, and the `DISASM=1` groups pass. Run in my emulator only.
- ☑ Documentation: memory map and size figures, the Feature Flags tables, the HEADER and ENVIRONMENT? glossary entries, and two new Section 5 items.

Open items

- ☐ **Please confirm in lwasm and MAME:** the 6n source assembles, ANS 33 and 34 pass (the interrupt-driven build has 24 bytes spare).
- ☐ **READMEs:** not reviewed. I could not find the updated READMEs in the project (only README.md and README_search_order_changes.md from October); please upload them again.
- ☐ `CASE` is not rebuilt by `SEE` and other `SEE` limits (part 9) still apply.
- ☐ A unit test group for the Search-Order words is still missing; the `ENVIRONMENT?` unit test group (16) does not yet check the new queries.
